

Gap Analysis Report

Discovery doc 06 · v1.0 · 2026-07-16

Gaps between the prototype (as documented in README/ROADMAP/User Guide) and an enterprise-quality, deployable-at-scale product. Severity: **S1** blocks safe production / legal exposure · **S2** blocks scale to 25+ clients or a core business objective · **S3** material quality/UX gap · **S4** enhancement. "Repo-ack" = the repo's own docs already acknowledge it (credibility point — these are honest docs).

ID	Gap
GAP-1	No documented, tested backup & restore (RPO/RTO undefined; restore never drilled)
GAP-2	OTA modification/cancellation emails have no linked-update path
GAP-3	WhatsApp templates (multi-language) + param plumbing missing — delivery can't turn on
GAP-4	No two-way message thread visible to operator (outbox only)
GAP-5	Silent failure of crons/forwarders/iCal fetches (no alerts, no last-success surfacing)
GAP-6	iCal sync only daily; lag window larger than necessary
GAP-7	Form C: fields captured but no artefact/reminder/submission support
GAP-8	DPDP data-principal rights absent (export/erase guest data); breach procedure absent; retention default
GAP-9	Money = whole-rupee float number
GAP-10	No password reset / user invites; owner hand-sets passwords
GAP-11	Invoices not statutory-grade: no stored invoice entity, no sequential numbering, no GST tax lines, browsable
GAP-12	Authorization depth: no field-level money masking; no Postgres RLS; raw-SQL scoping by convention on
GAP-13	No OTA payout reconciliation (OTA-collect bookings: owed vs received untracked)
GAP-14	No push/WhatsApp notification for escalations & conflicts (badge only)
GAP-15	Audit log covers only a narrow action set; no tamper-evidence; ID-document access not logged
GAP-16	Operator console is English-only — Khasi/Hindi UI absent
GAP-17	No observability: error tracking, structured logs, uptime monitoring per deployment
GAP-18	No fleet tooling: onboarding automation, version/health dashboard, coordinated upgrades across N de
GAP-19	No guest merge / duplicate resolution
GAP-20	Housekeeping lacks inspected state, deep-clean cadence, dirty-room booking guard
GAP-21	Accessibility unassessed (WCAG 2.1 AA)
GAP-22	No per-night rate breakdown on a booking (single amount)
GAP-23	No client data-export / offboarding path (data ownership promise)
GAP-24	No oversell safety-buffer feature (guide advises it manually)
GAP-25	Offline claims unverified: queue depth, conflict UX, which writes are safe offline
GAP-26	Community network cross-deployment topology undocumented (where do shared registries live?)
GAP-27	No MindBit-side billing/subscription tooling (monetisation is a Q3 grant milestone)
GAP-28	Positioning contradiction: "self-hosted / locally-owned" vs Vercel+Supabase+Cloud Run reference stack
GAP-29	Room-type-level booking absent (room fixed at creation) — deliberate; unratified trade-off
GAP-30	No staging/UAT environment or seeded demo tenant mentioned for client trials

Priority clusters

- **Production-safety cluster (do first):** GAP-1, 5, 17 (operability) + GAP-7, 8 (legal) + GAP-2 (correctness of the core promise).
- **Scale cluster (before client #10):** GAP-10, 18, 27, 28, 12.
- **Money cluster (before gateway/GST go-live):** GAP-9, 11, 13.
- **Experience cluster:** GAP-3, 14, 16, 4, 24.

What is *not* a gap (explicitly)

Rates-push to OTAs (impossible for single properties — permanent constraint, correctly refused); live cab dispatch (owned by ROOT sidecar); channel-manager replacement claims (product is honest about the residual window). The prototype's honesty about its own limits is a strength to preserve.
